FOREWORD

The Ministry of Statistics and Programme Implementation (MoSPI) has revised the base year of National Accounts Statistics to 2022-23 to better reflect structural changes in the economy and align with international standards, including the United Nations System of National Accounts. This revision incorporates improved data sources and updated methodologies, thereby enhancing the quality and relevance of macroeconomic aggregates.

In this context, the methodology for compilation of Gross State Value Added (GSVA) has been comprehensively reviewed. The present document is based on the recommendations of the Sub-Committee on Regional Accounts constituted by the Advisory Committee on National Accounts Statistics (ACNAS), with a focus on harmonization with National Accounts and ensuring consistency across States and Union Territories.

The guidelines outline the estimation of GSVA at current and constant (2022-23) prices using the production approach, with greater reliance on administrative data sources and improved indicators. The framework seeks to ensure methodological soundness, transparency and comparability, while remaining operationally feasible for implementation by State agencies.

MoSPI will continue to provide technical support to States/UTs for the adoption of these guidelines. Their implementation is expected to strengthen the quality and policy relevance of Regional Accounts in India.

I would also like to place on record my deep appreciation for the dedicated efforts of all officers and staff of National Accounts Division (NAD), MoSPI under the guidance of Shri Siddhartha Kundu, Additional Director General (NAD), MoSPI whose commitment, hard work and technical expertise have made the timely release of this publication possible.

(N.K. Santoshi)

MESSAGE

I would like to place on record my sincere appreciation for the dedicated efforts of the officers of the National Accounts Division (NAD) in the preparation of the revised methodology for compilation of Gross State Value Added (GSVA) with the new base year 2022-23. The document reflects a high degree of technical rigor, extensive consultation and alignment with the latest international standards, particularly the System of National Accounts (SNA). The meticulous work undertaken in reviewing data sources, refining estimation procedures and ensuring consistency between national and sub-national accounts is commendable.

The comprehensive sector-wise approach adopted in the methodology, along with incorporation of improved administrative data sources such as GST, Public Financial Management System and survey-based data will significantly enhance the robustness, comparability and transparency of State-level estimates. The efforts made to balance conceptual soundness with operational feasibility for States and Union Territories deserve special recognition. Such standardization is critical for strengthening the quality of regional accounts and supporting evidence-based policymaking.

I extend my heartfelt thanks to all officers and staff of NAD, MoSPI for their commitment and professionalism in bringing out this important document. I am confident that the adoption of this methodology by States/UTs will greatly improve the reliability and policy relevance of GSVA estimates, thereby contributing to more informed economic planning and analysis across the country.

(Siddhartha Kundu)

INTRODUCTION

Gross State Value Added (GSVA) is a key macroeconomic indicator that measures the economic performance of States and Union Territories by capturing the value of goods and services produced within their respective geographical boundaries. It serves as a critical input for the estimation of Gross State Domestic Product (GSDP) and provides valuable insights into the structure and growth dynamics of regional economies.

2. The estimates of GSVA over time indicate the pace and pattern of economic development of a State/UT. The sectoral composition of GSVA reflects the relative contribution of different sectors of the economy and facilitates analysis of structural transformation. These estimates constitute an important input for policy formulation, planning and monitoring of developmental programmes at the State level.

3. At the national level, estimates of Gross Domestic Product (GDP) are compiled by the National Statistics Office (NSO), Ministry of Statistics and Programme Implementation, in accordance with the principles and recommendations of the System of National Accounts. The estimates of GSVA and thus GSDP are compiled by the Directorates of Economics and Statistics (DES) of the States/UTs, broadly following the same concepts, definitions, classifications and methodological framework to ensure consistency and comparability with national accounts.

Methodology in General for Regional Accounts

4. The estimates of GSVA and State Income can conceptually be compiled using two approaches, namely, the **income originating approach** and the **income accruing approach**.

Income Originating Approach

5. The income originating approach measures total value added by production of goods and services within a region's borders. It represents the net value of goods and services produced within the region, irrespective of whether income generated from such production activity is ultimately received by residents within or outside the State.

Income Accruing Approach

6. This approach measures the income accruing to the residents of a State/UT, irrespective of the place of its generation. It reflects the income available to residents and is therefore considered a better indicator of economic welfare. However, its implementation requires detailed information on Inter-State income flow. In the absence of such data, especially in an open and integrated economy, the preparation of GSVA estimates using this approach remains constrained.

7. Further, there are three possible methods described below that can be used for the estimation of Regional Accounts according to their suitability and data availability.

Top-Down Approach

8. In the top-down approach, national level aggregates are first estimated and then distributed among States using suitable indicators. This method can be used when State-level estimates are not directly available. It ensures consistency with higher-level estimates but may not fully capture local variations.

Bottom-Up Approach

9. The bottom-up approach involves direct estimation at the state level by collecting data from households, enterprises/establishments and administrative records within each state. State estimates are then aggregated to obtain national level estimates. This approach better reflects local economic conditions but requires detailed and reliable state level data.

Mixed Approach

10. The bottom-up method is rarely encountered in its pure form. There are always gaps in the data, which have to be filled using a top-down approach.

Three Approaches of GVA compilation

11. At national level GDP is measured using three standard approaches namely Production Approach, Income Approach and Expenditure Approach and India is no exception.

Production Approach: Under the production approach, GDP at market prices is estimated as the sum of value added generated by all economic activities within the country's territory, i.e., output at basic prices *minus* intermediate consumption *plus* net taxes on products.

Income Approach: The income approach measures GDP as the sum of compensation of employees, gross operating surplus, and gross mixed income, along with net taxes on product and other taxes on production, which is mainly applied to non-market producers particularly the government sector.

Expenditure Approach: The Expenditure Approach presents GDP from the demand side and it is composed of:

- (i) Private Final Consumption Expenditure (PFCE),
- (ii) Government Final Consumption Expenditure (GFCE),
- (iii) Gross Fixed Capital Formation (GFCF),
- (iv) Change in Stocks (CIS), and
- (v) Acquisition less disposals of valuables
- (vi) Net Exports of Goods and Services.

12. At the State level, GSVA and GSDP estimates are compiled and published primarily using the production and income approaches. None of the States compile all components of the

GSDP following expenditure approach due to paucity of required data at state level. The present document deals only **with production side estimates of GSDP (GSVA-Net Product taxes). GSVA and GSDP estimates are compiled by the States/UTs in accordance with the technical guidelines and methodological framework prescribed by the National Statistics Office (NSO), Ministry of Statistics and Programme Implementation (MoSPI).**

13. The estimation of GSVA following the **production approach** is derived as the difference between output and intermediate consumption:

GSVA = Output – Intermediate Consumption

14. In certain sub-sectors, particularly those relating to **non-market activities and public sector services**, the **income approach** is also adopted, wherein value added is measured as the sum of Compensation of Employees (CE), Operating Surplus (OS)/Mixed Income, and Consumption of Fixed Capital (CFC).

GSVA = CE +OS +CFC

15. The aggregate of GSVA across all economic activities after adjusting industry-wise Financial Intermediation Services Indirectly Measured (FISIM), then adjusted for taxes and subsidies on products, yields the Gross State Domestic Product (GSDP):

GSDP = $\sum$ GSVA_i + Taxes on Products – Subsidies on Products

16. Net State Domestic Product (NSDP) is derived by deducting Consumption of Fixed Capital (CFC) from GSDP:

NSDP = GSDP – Consumption of Fixed Capital (CFC)

17. Per Capita Income (PCI), an important indicator of the average economic well-being of the population, is estimated as:

Per Capita Income = NSDP/Mid-Year Projected Population

Estimation Framework

18. The methodology for the estimation of GSVA and related aggregates follows the framework of the System of National Accounts (SNA 2008) and is aligned with national accounts practices to ensure consistency and comparability.

19. In accordance with the System of National Accounts (SNA), the **institutional sector approach** is followed for the compilation of national and regional accounts. Under this approach, the economy is classified into the following five institutional sectors:

A. Non-Financial Private Corporations (NFPC) Sector

B. Financial Corporations (FC) Sector

C. General Government (GG) Sector

D. Household Sector

E. Non-Profit Institutions Serving Household (NPISH) Sector (In case of India, estimates for NPISH are included in Household Sector)

20. In line with GDP, for GSDP estimation also, the whole economy is divided into 11 broad industries (i) Agriculture & Allied, (ii) Mining, (iii) Manufacturing, (iv) Electricity, Gas, Water Supply & Other Utility Services, (v) Construction, (vi) Trade, Repair, Hotel & Restaurants, (vii) Transport, Storage, Communication & Services related to Broadcasting (viii) Financial Services (ix) Real Estate, Ownership of Dwelling & Professional Services (x) Public Administration and Defence, and (xi) Other Services. Compilation of GSVA for these industries is undertaken using a combination of **direct estimation/bottom-up approach and allocation methods/top down approach**, depending on the availability and reliability of data.

21. Industry-wise estimates are compiled for each institutional sector and their compilation methodology for institutional sector remains the same across industries except for the Household Sector. In case of the Household Sector, estimates for Agriculture, Construction & Ownership of Dwellings industries are compiled following a methodology which is different from the one used in other industries.

Broad Compilation Methodology at Institutional Sector

A. Non-Financial Private Corporate (NFPC) Sector

22. All-India estimates for different industries in respect of the NFPC sector are compiled using production approach. Data of this institutional sector is obtained from MCA-21 database of Ministry of Corporate Affairs, GoI. The All-India estimates are then allocated among states using state-wise ratio of outward supply from GST data across industries (Non-Financial Services, Electricity, Gas, Water Supply and Remediation). All India estimates for **Construction Industries** pertaining to NFPC sector are allocated on the basis of state-wise ratios of outward supplies/taxable values of all the construction related items.

23. For the manufacturing sector, All-India estimates of GVA at current prices are compiled using the production approach and allocated to states (by compilation category) on the basis of compilation category-wise and state-wise value added in manufacturing from Annual Survey of Industries (ASI).

24. For ASI non- corporate Sector, state-wise estimates of GVA, by compilation category, are obtained from ASI (Factories covered under ASI but are not corporations). For the year when ASI results are not available, estimates of the preceding year are extrapolated using compilation category-wise Index of Industrial Production (IIP) and Wholesale Price Index (WPI) / Output Producer Price Index (OPPI) as per availability.

B. General Government Sector

25. The General government sector comprises the Central Government, State Governments, Local Bodies and Autonomous Institutions. Net value added in respect of state governments, local bodies and state autonomous institutions for the respective states are estimated directly following the income approach. Drawing and Disbursing Office (DDO) code-wise (location based) Public Financial Management System (PFMS) data in respect of each object head from the office of Comptroller General of Accounts (CGA) is used for compilation of State-wise net value added from central government following income approach.

C. Financial Corporations Sector

26. All India GVA estimates of Financial Services sector are compiled at different sub-sector level as per SNA classification separately for 9 sub-sectors viz. Central Bank; Deposit taking Corporations except Central Bank; Money Market Funds (MMF); Non MMFs; Other Financial Intermediaries except Insurance Corporations and Pension Funds (ICPF); Financial Auxiliaries; Captive Financial Institutions and Money Lenders; Insurance Corporations; and Pension funds. The sub-sector wise data sources and methodology for compilation of estimates is given below:

- a) Central Bank (RBI): GVA is estimated through Cost method where $\text{Output} = \text{IC} + \text{CE} + \text{CFC} + \text{Net taxes on production}$ by using RBI Annual Report.
- b) Deposit taking corporations except Central Bank (Nationalized Banks, Domestic Private Sector Banks, Foreign Banks, Regional Rural Banks, Cooperative Banks, Post Office Savings Bank etc.): In case of nationalized public sector banks production approach is followed using data in respect of these banks from Statistical Table Related to Banks in India (STRBI) published by the RBI.

Where, $\text{GVA} = \text{Output} - \text{IC}$

$\text{Output} = \text{FISIM} + \text{Actual Receipt (AR)}$

- For Deposit-Taking Enterprises, FISIM is calculated as $\text{FISIM on loans} + \text{FISIM on deposits}$
 - For Non-Deposit-Taking Enterprises, FISIM is calculated as FISIM on loans
- c) Money Market Funds (MMF) & Non MMF Investment Funds: GVA is estimated following cost approach ($\text{Output} = \text{IC}$) using P/L Accounts and Balance Sheets received from SEBI.
 - d) Other Financial Intermediaries except insurance corporations and pension funds (ICPF) (Public Sector Non-Banking Financial Corporations (NBFCs) and State Financial Corporations (SFCs)): For public sector NBFCs and SFCs GVA is estimated using

production approach, as outlined above in case of Deposit Taking Corporations except Central Bank for which information from annual report of concerned Financial Corporation is used.

- e) Financial Auxiliaries (SEBI, IRDAI, Stock Exchanges, Stock Brokers & AMC, Insurance Agents, Admn. Funds of EPFO, etc.): GVA is estimated through Production / Income Approach based on annual reports/accounts of concerned financial entities (except Insurance agents). For insurance agents output is computed as the total value of commission to agents reflected in respect of public and private sector companies of life and non-life insurance and for IC, moving average of the ratio of IC to Output from Annual Survey of Unincorporated Sector Enterprises (ASUSE) (moving average of three years) is used.
- f) Captive Financial Institutions and Money Lenders (except insurance agents): Estimates of GVA is compiled through production approach using ASUSE and All India Debt and Investment Survey (AIDIS).
- g) Insurance Corporations (Insurance Corporations including Postal Life Insurance (PLI)): Production Approach is used to calculate GVA by using Annual Financial Statement from annual reports of Public Insurance Companies and Data received from IRDAI for Private Insurance Corporations.
- h) Pension funds: GVA is estimated through cost approach using Annual Report of EPFO, NPS, Coal Mines Provident Fund Organisation (CMPFO), Seamen's Provident Fund Organisation (SMPFO) etc.

Unlike, all India GVA, the GSVA estimates for **Financial Corporations** sector are prepared separately for the following sub-sectors by allocating All-India estimates using different indicators.

- i. Central Bank (Banking Department of RBI)
- ii. Deposit Taking Corporations/Commercial Banks
- iii. Non-banking Financial Corporations
- iv. Non-banking Financial Companies
- v. Post Office Saving Banks
- vi. Co-operative Credit Societies
- vii. Insurance Corporations
 - Life Insurance
 - Postal Life Insurance (PLI)
 - Non-Life Insurance
 - Employees State Insurance Corporation (ESIC)
- viii. Employees' Provident Fund Organization (EPFO)
- ix. Money Lender

Detail of indicators used for allocating GVA for the above-mentioned sub-sectors is given in the tabular format at Annexure-I.

D. Household Sector including Quasi-Corporations and Non-Profit Institutions Serving Household (NPISH) (Except Agriculture, Construction and Ownership of Dwellings)

27. All-India GVA estimates in respect of unincorporated segment of manufacturing and services sectors are compiled by using GVA per worker (GVAPW) from ASUSE and workforce estimates from Periodic Labour Force Survey (PLFS) after adjusting with projected population (based on the Report of M/o Health & Family Welfare).

28. All India GVA among States is then allocated using industry-wise and state-wise share of GVA from ASUSE. Given that both ASUSE and PLFS now provide annual results, the State-wise GVA estimates for the unincorporated sector will henceforth be generated annually.

E. Industry Specific compilation procedure

Agriculture and Allied Sector

29. The sector comprises four sub-sectors viz., (i) Crops (ii) Livestock (iii) Forestry and Logging (iv) Fishing and Aquaculture. The estimation procedure primarily relies on the direct (bottom-up) approach. For this sector both production and price data used for compilation of GVA is available at State/UT level. Hence, State/UT-wise GVA from Agriculture and Allied sector is directly estimated using production approach, except for firewood and toddy where consumption/expenditure is followed. Detail methodology and data sources are given in tabular format at Annexure-I.

Construction Sector

30. The commodity flow approach continues to be followed for the compilation of GVO and GVA at the national level across both series.

$$\text{Total GVO} = \text{General Government (GG)} + \text{Non-Dept Enterprises (NDE)} + \text{Private Corporations} + \text{Households}$$

31. The methodology for the compilation of state-wise GVA from construction under Non-financial Private Corporate and General Government is explained in para 22 to 24 and 25 and respectively. The methodology for the compilation of state-wise GVA from construction under Household Sector is outlined below:

32. The GVA from Construction comprises of the following components: i) Dwellings, Other Buildings & Structures (DOBS) ii) Construction in plantations iii) Mineral explorations. GVA of Dwellings, Other Buildings & Structures further consists of two components namely (i) pucca and (ii) kutchha. The former continues to be measured through the commodity flow approach, and the latter through the expenditure approach. In addition to these estimates,

expenditure on construction activity in plantations and mineral explorations is separately estimated and included in GVA from construction.

33. The GVA of household sector derived as residual in the commodity flow approach at national level is further bifurcated into Rural Residential buildings (RRB), Urban Residential Buildings (URB), Non-Residential Buildings and Other Construction Works (NRBOCW) and NPISH. State/UT-wise results of AIDIS 2019 duly adjusted for growth in number of dwellings and price changes of materials used in urban and rural construction (for estimating RRB and URB at current prices) and combined growth of GVO of all industries excluding construction (for estimating NRBOCW at current prices) to be used. For NPISH, GST data to be used to estimate the availability of basic input materials in the State/UT (using HSN-wise outward supplies in case of GSTR-1). These data will be used to arrive at State/UT-wise ratios of availability of construction material and these ratios to be utilized to allocate GVA of other households among States/UTs.

34. The estimation of GVA of Plantation Activities (which is considered Kutcha Construction) to be made using year-wise increment in plantation crop-wise area under plantation provided by DESs/M/o Agriculture & Farmer's Welfare and plantation crop-wise cost structure provided by NABARD. The plantation/ crop-wise cost structure provided by NABARD is available separately for each State/Ut-wise by NABARD for each FY and hence this dynamic cost structure to be used for estimation of state-wise GVA of Plantation Activities. Details of data sources used and methodology is given in Annexure-I.

Estimation of GSVA for Ownership of Dwellings (Urban and Rural)

35. GSVA for ownership of dwellings in urban areas is directly estimated as the gross rental value comprising both actual rents paid and imputed rents for owned dwellings less the cost of repairs and maintenance. For rural areas, the user cost approach is followed to estimate the value of housing services.

36. For urban areas, the number of dwellings is estimated using Ministry of Health & Family Welfare (MoHFW) projected population figures along with average household size data from the Household Consumer Expenditure Survey (HCES) 2022–23 and the average rent per dwelling derived from the HCES 2022–23.

F. Supra Regional Sector

37. Certain economic activities (mostly public part) transcend State boundaries and thus their economic contribution cannot be assigned to any one state. Such activities are Railways, Communications and Services Related to Broadcasting, Financial Services, Central Govt. popularly known as the supra-regional activities.

38. Central Government part and Financial services have already been discussed under General Government and Financial Corporations Institutional sector.

Communication and Services Related to Broadcasting Sector (Public Part)

39. Under the Communication and Services Related to Broadcasting Sector, we cover 1 Departmental Enterprise (DE), namely the Department of Posts and 7 Non-Departmental Enterprises (NDEs), which are:

- a. Post
- b. Bharat Sanchar Nigam Limited (BSNL)
- c. Power Grid Teleservices Ltd. (Now Power Tel)
- d. Bharat Broadband Network Limited (BBNL)
- e. RailTel Corporation
- f. Film Development Corporations
- g. Mahanagar Telephone Nigam Limited (MTNL)
- h. Prasar Bharati (Broadcasting)

40. State-wise GVA for BBNL, RailTel Corporation, Mahanagar Telephone Nigam Limited (MTNL), Film Development Corporations is directly available on a State-wise basis through an analysis of their respective annual reports. For the estimation of State-wise GVA of Post, BSNL, Power Grid Teleservices Ltd. (Now PowerTel) and Prasar Bharati, efforts have been made to minimize the extent of allocation and to obtain direct State-wise information for calculation of GVA using production approach/income approach from the respective organizations. Details of Communication and Services Related to Broadcasting (Public Part) is given in Annexure-I.

Railway (Transport)

41. The GVA of Railway Transport is estimated as the sum of value added by (i) Departmental Enterprises (DE) (ii) Private Railways, and (iii) Non-Departmental Enterprises (NDE) engaged in railway transport services. Methodology for Compilation of State-wise GVA of Railway (Transport) institution -wise outlined below:

State-wise Compilation of GVA of Railways (Public-DE):

- i. The GVA of Railways is first estimated at the all-India level using data from Indian Railways under the Ministry of Railways, primarily based on railway accounts and statistical reports. The estimation follows the income approach, wherein GVA is derived from compensation of employees and operating surplus.
- ii. The all-India GVA is **distributed among the different railway zones** based on: (i) **compensation of employees**, allocated in proportion to total staff cost excluding the cost of staff engaged in railway workshops (manufacturing) and artisans (construction); and (ii) interest and surplus (including rent and depreciation), allocated in proportion to capital at charge of the respective zones. A portion of wages and salaries attributable to the Railway

Board and other head offices and Railway Protection Security Force (RPSF) is first separated from the all-India wages and salaries and allocated to the respective states where these offices are located. In the absence of direct availability of Head Office (HO) share in wages and salaries, an amount of 5% of salary and wages is presumed to be the share attributed to HO and subtracted from zonal salary and wages.

iii. Further, the zone-wise value added is bifurcated into passenger and goods traffic based on their respective earnings. These estimates are then allocated to the states within each zone using traffic indicators, namely vehicle (four-wheeler) kilometers per route per day for passenger traffic and net tonne kilometers per route per day for goods traffic, reflecting the level of railway activity in each state.

Railway NDEs: State-wise GVA of Railway NDEs is compiled by analysing their annual reports. Estimates of GVA at current prices are compiled using the production approach. Estimates of State NDEs are allocated directly to States whereas estimates of Central NDEs are allocated to States using the State-wise data on No. of employees and Gross Block. CE is distributed on the basis of the number of employees in each State, while Operating Surplus (OS = GVA - CE) is distributed in proportion to the State-wise gross block of that NDE.

Private Railways: In 2011-12 series, GVA of the Private Railways obtained from the MCA-21, is allocated in the proportion of the revenue of the private railway companies. Now in 2022-23 series, GVA of Private Railways among States/UTs to be allocated using GST data.

Consumption of Fixed capital (CFC)

42. Estimates of consumption of fixed capital are obtained at national level using Perpetual Inventory Method (PIM). This is a method of constructing estimates of CFC (and the net fixed capital stock) from a time series of gross fixed capital formation (GFCF). **Industry-wise and institutional sector-wise allocation of CFC among States/UTs is given at Annexure-II.**

Allocation of Product Taxes and Product Subsidies among States/UTs

43. The total GST reported in the Budget documents comprising CGST, SGST, IGST, and Cess is to be allocated to States and Union Territories based on their respective shares in tax collections, as reflected in data available from the GST portal.

Estimation of GSVA at Constant Price under Production Approach

44. Constant price estimation, often referred to as measuring real output, is a core requirement in national accounts to remove the effect of inflation and capture true economic growth. Constant price estimates are generally compiled by States/UTs. The 4 methods outlined below, are suggested to the States/UTs in the preparation of Gross State Value Added (GSVA) at constant prices.

I. Revaluation method

In this method, quantities produced in the current period are valued at base year prices. This approach is applied in sectors such as agriculture & allied and also to some part of mining where data on quantities and prices are separately available both at current year and base year.

II. Single deflation method

Single deflation is a method in national accounting used to estimate constant price GVA by applying a single price deflator directly to the current price value added. It implicitly assumes that the price of inputs moves in sync with the price of output. As per the recommendation of SNA, in the new series of National Accounts with base year 2022-23, use of single deflation for estimating Constant price GVA has been discontinued.

III. Double Deflation Method

In this method, output and intermediate consumption are deflated separately using different price indices, and real gross value added (GVA) is derived as the difference between the two. It provides a more accurate reflection of real value addition, as it accounts for differing price movements in outputs and inputs, though it requires comprehensive data on both. This method is used in organized manufacturing where detailed input structure for every output of a particular industry is available from ASI.

IV. Single Extrapolation/Volume Extrapolation

GVA at current prices is moved forward using volume indicators. It is preferred over single deflation because it assumes a stable input-output ratio in *volume* terms rather than assuming input and output prices move in sync. In the new 2022-23 series, this method is applied to many sectors such as EGWR, services sectors and some mining sub-sectors using volume indicators.

45. With the revision of the base year to 2022–23, the methodology has been strengthened through the incorporation of improved data sources, refined estimation techniques, and enhanced sectoral coverage. **Industry-wise Details for estimation of Current Prices, Constant Prices and CFC are given in Annexure-I. and Annexure-II respectively.**

ANNEXURE-I

GROSS VALUE ADDED AT BASIC PRICES

Item	Data: Source	Method of estimation		Remarks
		At current prices	At constant (2022-23) prices	
(1)	(2)	(3)	(4)	(5)
1. Agriculture (Crop Sector)				
(a) Value of output				
(1) Major and Minor Crops				
(i) Major Crops	♦ Production: Ministry of Agriculture & Farmer Welfare (MoAgFWs) ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(ii) Minor Crops	♦ Production: Ministry of Agriculture & Farmer Welfare (MoAgFW) & State DESs ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(iii) Small Millets	♦ Production: Ministry of Agriculture & Farmer Welfare (MoAgFW) & State DESs ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	In case of non-availability of prices, the same may be estimated as weighted average price of relevant cereals (Jowar, Bajra, Barley, and Ragi) with weight being the quantity of production of respective individual crops.

Item	Data: Source	Method of estimation		Remarks
		At current prices	At constant (2022-23) prices	
(1)	(2)	(3)	(4)	(5)
(iv) Other Pulses	♦ Production: Ministry of Agriculture & Farmer Welfare (MoAgFW) & State DESs ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	In case of non-availability of prices, the same may be estimated as weighted average price of relevant pulses (Arhar, Urad, Moong, Lentil and Horsegram) with weight being the relevant quantity of production of individual crops.
(2) Commercial Crops				
(i) Tea	♦ Production of processed tea: Tea Board ♦ Prices: State DESs	Value of output = current year production of raw tea × current year price	Value of output = current year production of raw tea × base year price	Production of raw tea = processed tea / 0.225
(ii) Coffee	♦ Production: Coffee Board ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(iii) Rubber	♦ Production: Rubber Board ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	

Item	Data: Source	Method of estimation		Remarks
		At current prices	At constant (2022-23) prices	
(1)	(2)	(3)	(4)	(5)
(iv) Cashew Nut and Cocoa	♦ Production: Directorate of Cashewnut and Cocoa Development Board ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(v) Opium	♦ Production: Central Bureau of Narcotics ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(vi) Arecanut	♦ Production: Directorate of Arecanut and Spices Development ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(vii) Flowers (separately for cut flowers and spike)	♦ Production of cut flower: Ministry of Agriculture & Farmer Welfare (MoAgFW) ♦ Production of spike: State DESs ♦ Prices: State DESs	Value of output = current year production × current year price	Value of output = current year production × base year price	
(3) Miscellaneous Crops

		based on state-wise GSVA at basic prices (excluding GSVA in public administration and other services like health, education).	Fertilizer subsidy: growth observed in the consumption of NPK fertilizers. Electricity subsidy: growth observed in subsidized units consumed in respective states / growth in sales of electricity for domestic and agriculture purpose remaining subsidies: deflated with the overall IPD.	

ANNEXURE-II

Table: Industry-wise and institutional sector wise method approved for estimation of CFC for use in compilation of net aggregates at State/UT level

S.No.	Industry	Methodology
1.	Agriculture	
1.1	Crops	
(i)	Plantation	State-wise Area under plantation to be used to allocate among states
(ii)	Irrigation (General Government)	Stock of fixed assets calculated on the basis of capital outlay for irrigation DE (State Budget) added to base year stock figure as per existing method and to be duly adjusted GFCF and CFC using PIM
(iii)	Private sector excluding plantation	value of stock of assets in base year to be estimated using results of AIDIS,2019 on stock of capital assets and PIM to be used in subsequent years
1.2	Livestock	Using total stock of live animals along with stock value of capital assets from AIDIS,2019.
1.3	Forestry & logging	For GG and DE: Value of stock of fixed assets in base year to be estimated using Blades method and PIM to be used for subsequent years
		For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years
		For Private Sector: to be allocated using GSVA of forestry
1.4	Fishing and aquaculture	Using results from Marine Census and Study on Inland Fisheries for State/UT-wise stock of Machinery & Equipments used in Fisheries
2.	Mining & quarrying	For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years

S.No.	Industry	Methodology
		For Private Corporations: Information collected in Annual Returns by Indian Bureau of Mines
		For Minor Minerals: Based of GSVO
3.	Manufacturing	
3.1	Organised Manufacturing	For DE: PIM method constructed using time series of stock of fixed assets.
		NDE and Pvt Corp: PIM method constructed using time series of stock of fixed assets.
3.2	Unorganised manufacturing	Using Blades Method and results of ASUSE, value of stock of assets will be estimated in base year in respect of industries covered in ASUSE and PIM to be used in subsequent years.
4.	Electricity, Gas, Water supply & other utility services	For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years
		For Household Sector: Using Blades Method and results of ASUSE, value of stock of assets will be estimated in base year in respect of industries covered in ASUSE and PIM to be used in subsequent years. In case of Water Supply, Remediation and Other Utility Services, Using PIM constructed from stock of biogas plants (Gas) and stock of renewable energy assets (Electricity)
		Private Corporations: Using GSVA
5.	Construction	For GG: Value of stock of fixed assets in base year to be estimated using Blades method and PIM to be used for subsequent years
		For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years.

S.No.	Industry	Methodology
		For Quasi Corp & Household Sector: Using Blades Method and results of ASUSE, value of stock of assets will be estimated in base year and PIM to be used in subsequent years
		For Private Corp: Using GSVA
6.	(i) Trade & repair services (ii) Hotels & restaurants (iii) Water Transport (iv) Services incidental to transport (v) Storage (vi) Communications (vii) Financial Services (viii) Real Estate and Professional Services	For DE: Value of stock of fixed assets in base year to be estimated using Blades method and PIM to be used for subsequent years
		For NDE: From Analysis of State NDE Reports, ng DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years
		For Quasi and Household Sector: Using Blades Method and results of ASUSE, value of stock of assets will be estimated in base year in respect of industries covered in ASUSE and PIM to be used in subsequent years.
		For Private Corp: Using GSVA
7.	Railways	Using capital at charge
8.	Road Transport	For DE: Value of stock of fixed assets in base year to be estimated using Blades method and PIM to be used for subsequent years
		For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years

S.No.	Industry	Methodology
		For Quasi-Corporations and Household Sector: Using Blades' Method and results of ASUSE, value of stock of assets will be estimated in base year in respect of industries covered in ASUSE and PIM to be used
		For Private Corp: Using stock of functional registered commercial Vehicles
9.	Air Transport	For NDE: From Analysis of State NDE Reports, using DPE publication for Central NDEs, the value of stock will be estimated for base year and PIM to be used in subsequent years For Private Corp: Using GSVA
10.	Ownership of dwellings	value of stock of residential buildings to be estimated using results of AIDIS, 2019 and then PIM to be used for subsequent years
11.	Public admin & defence	Value of stock of fixed assets in base year to be estimated using Blades method and PIM to be used for subsequent years
